

Executive Summary Template

Recommended Solution

- Use the predictive model to identify customers with a high risk of churn and target them with personalized retention strategies.
- Continue improving the model by incorporating additional customer data and addressing class imbalance to improve its ability to detect churn.

Situation

- The client has experienced increasing customer churn and believes that rising price sensitivity is one of the main reasons customers are switching providers

Complication

- The analysis showed that churn is influenced by multiple factors, not just price. New features were created from pricing and customer data to improve the predictive analysis.
- A Random Forest model achieved approximately **90% accuracy**, but the low recall indicates that additional improvements are needed to better identify customers who are likely to churn.

Question

- How can the company identify customers likely to churn and reduce customer loss?
